# New Features in Vault V14 API (13.5.4 Release)

*Release Date: February 12, 2016*

We are pleased to bring you the following enhancements to the V14 API in this week's release. Refer to the Vault Release Notes for additional information about the 13.5.4 release. See the Vault Developer Portal for API documentation.

## Case-Insensitive Queries

By default, VQL queries are case-sensitive. Filtering results for "field__v=value" where the value is entered in lower-case, would produce no results if the stored value includes capital letters. With this enhancement, VQL adds the *caseinsensitive()* function which allows users to perform non-case-sensitive queries by forcing the filters on *String* fields to operate as case-insensitive. This new function can be used in queries on any standard or custom Vault Object.

## FIND on Objects & Single Field Scope

VQL queries on Vault Objects now support keyword searching using the **FIND** command. VQL adds an ability to search across all fields, or a single field on an object, with the search scope specified using the standard **SCOPE** keyword. This feature is currently limited to *String* fields only.

💬 Feedback

## Retrieve Deleted Object Record IDs

The Vault Objects API now allows users to retrieve the ID values of object records that were deleted from a vault within the past 30 days.

## Notable API Fixes

| Issue | Issue No. |
|---|---|
| We've improved the error message text which is returned when invalid syntax errors occur in VQL. This affects all API versions. | DEV-74585 |
